

RELEASE NOTES

Product	Snow Inventory Agent for Windows
Version	6.3.0
Release date	2019-09-25
Content	Features Corrections

FEATURES

The following features have been implemented in Snow Inventory Agent for Windows 6.3.0:

Option to disable all updates

It is now possible to configure the Agent to never retrieve updates from its configured endpoint(s). This includes updates to the agent binaries, configurations, additional files, web and cloud application patterns.

This feature can be activated configuring the SystemSetting “disable_all_updates”.

CORRECTIONS

The following corrections have been implemented in Snow Inventory Agent for Windows 6.3.0:

- The external library cpuidsdk(64).dll is no longer extracted in the agent folder when the SystemSetting "hardware.scan.enable_cpuid" is set to "false" (PRB0042476).
- In some scenarios temporary files were left on the client after a scan involving virtualized applications. This is no longer the case (PRB0042482).
- The agent now removes empty snowpack files to prevent issues with some external proxy configuration (PRB0042490).
